Decoding Protein Synthesis - Instructions Cells use a multistep process to make the proteins that they need. The thesis stating that information flows from DNA to RNA to protein is called Central Dogma. The DNA serves as the instructions for making the protein, and RNA is also critically important to carrying out the process of protein synthesis. The process is divided into two main parts:

Decoding DNA. For years, the exact means by which the DNA coded for structures, chemicals and other behaviors in living things was a mystery. Scientists now know which mRNA codons match each amino acid. This means that if you know the sequence of DNA or mRNA, you can figure out the sequence of amino acids that make a protein.

The ribosome continues to match anticodons to codons and add amino acids to the protein. Termination: Occurs when a “Stop” codon is reached. The mRNA, ribosome, tRNA, and protein are all released. The protein folds into its shape and starts to work in the cell. The other components can be reused to make the protein again.
