LibGen is a unique concept in the category of eBooks, as this Russia based website is actually a search engine that helps you download books and articles related to science. It allows you to download paywalled content for free including PDF downloads for the stuff on Elsevier's Science Direct website. Even though the site continues to face legal issues due to the pirated access provided to books and articles, the site is still functional through various domains.

The first two volumes are set at an introductory level; they are intended for students with a solid grounding in the concepts of real analysis, but possibly with rather limited detailed knowledge. The plan of the work is as follows: Volume 1: The Irreducible Minimum ; Volume 2: Broad Foundations ; Volume 3: Measure Algebras

Volume 1 (Chapters 1-5) is devoted to the classical theory of measure and integral. Whereas the first volume presents the ideas that go back mainly to Lebesgue, the second volume (Chapters 6-10) is to a large extent the result of the later development up to the recent years. The central subjects in Volume 2 are: transformations of measures, conditional

measures, and weak convergence of measures.

For instance, the Lebesgue measure of the interval $[0, 1]$ in the real numbers is its length in the everyday sense of the word, specifically, 1. Technically, a measure is a function that assigns a non-negative real number or $+\infty$ to (certain) subsets of a set X (see Definition below).

Measure theory is that part of mathematics which is concerned with the attribution of weights of 'measure' to the subsets of some given set. Such a measure is required to satisfy a natural condition of additivity, that is that the measure of the union of disjoint sets should be equal to the sum of the measure of those sets.

While reading Bogachev's Measure Theory Vol I, I've stumbled upon a bit I don't follow: I don't understand the reasoning behind the very last sentence in the proof of Corollary 1.2.9 (see image below); namely, I don't see what follows from the second assertion nor do I understand the implication.

A measure m is a law which assigns a number to certain subsets A of a given space and is a natural generalization of the following notions: 1) length of an interval, 2) area of a plane figure, 3) volume of a solid, 4) amount of mass contained in a region, 5) probability that an event from A occurs, etc.
