Measurements of formation resistivity have advanced, advances have been made in the design of sonic tools and in the processing of their recorded signals, and new methods of looking at the distribution of pore sizes, their fluid content, and formation flow potential have become widely used.

A large investment is made by oil and gas companies in acquiring open hole log data, logging activities can represent between 5% and 15% of total well costs. It is important therefore to ensure that the cost of acquisition can be justified by the value of information generated

"Open hole logs" are run before the oil or gas well is lined with pipe or cased. "Cased hole logs" are run after the well is lined with casing or production pipe. Wireline logs can be divided into broad categories based on the physical properties measured. History [edit]

into a hole which has just been drilled, and before it is cased, are called open-hole logs. Logs run after the well is cased are called cased-hole logs. Open hole logs are mainly used to determine the petrophysical properties of the rocks.

is penetrated by an open hole log before casing or cementing the wellbore while Cased-hole logging refers to the logging that is done after the wellbore has been cased. In Open Hole Logging, the rock formation inside the wellbore is bare and the measurements and other data can be taken accurately.

**Logging? - Definition
from Petropedia**

Openhole calipers
comprise up to six
arms attached to the
body of a sonde and
held against the
borehole wall by spring
action. They provide a
continuous
measurement of
borehole diameter. In
general, one- and two-
arm calipers measure
only the maximum
diameter where a hole
is not circular.
